Figure 5.10  Subsidence post at the Everglades Research and Education Center, showing the approximate location of the soil surface in 1924, 1954, and 1984. The post, which rests on bedrock, is 9 ft tall. The soil elevation in 1984 was approximately 4 ft above bedrock. Thus approximately 5 ft (60 in.) of subsidence occurred during the 60-year period from 1924 to 1984. (Photo credit: G. H. Snyder.)
